Perspective on Textual Production, Student Collaboration, and Social Networking Sites

PROBLEM

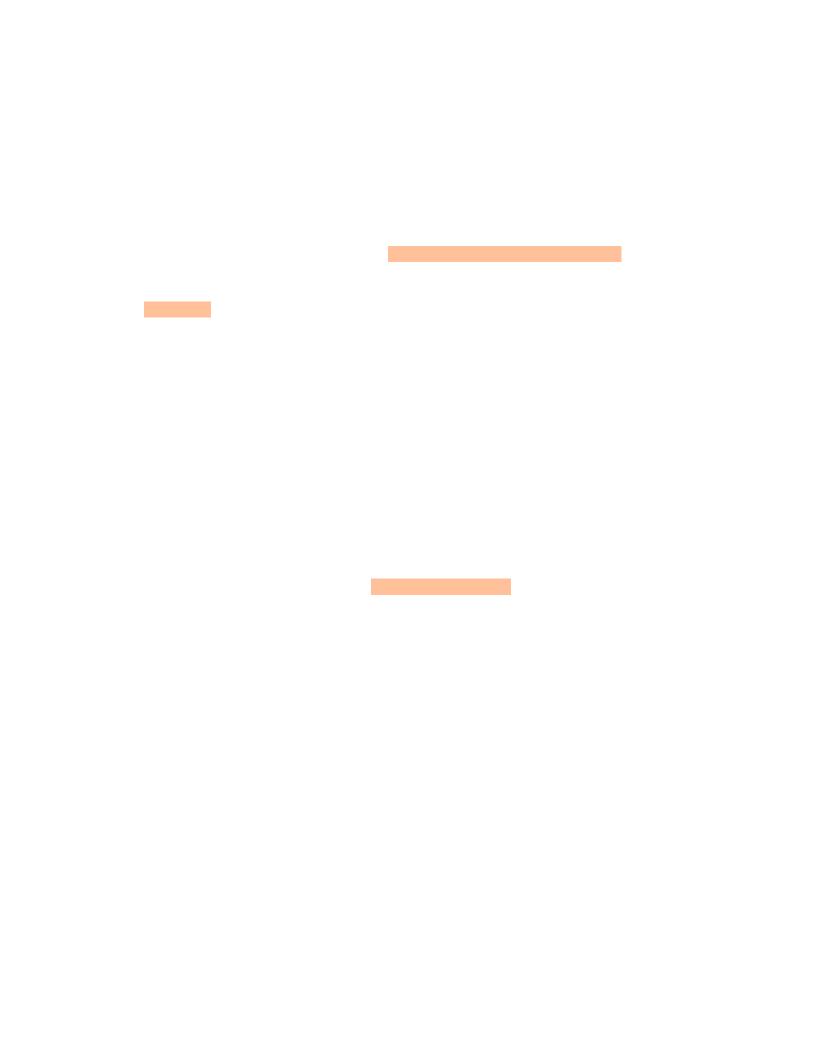

The field of composition has long valued collaboration in every part of the writing processin the invention, composing, and revisions stages (Roskelly, 2000; Howard, 2001). This belief has been espoused in composition classrooms on campuses around the world. Likewise, recent research has shown that collaborative learning can be successfulctionable highlighting the neveending process nature of composition when conducted in virtual spaces using visual media (Price & Warner, 2007). In addition to facilitating active writing processes, at least one study has also proven that the productable borative writing done exclusively online can be deemed as effective, if not more so, than the same work done in a traditional frontal

Because of this perceived divide between social attitudes within strictly defined spaces, students may experience difficulty switchibetween their personal goal of being heard and their academic goal of pleasing the instructor. While instructors may extend their academic space

inherent nature of social and spatial forces juxtaposed when subjects interact within a given situated space (p. 6). When considering using technology in academic spaces, as it is social like Facebook this comprehensive view becomes more important as instructors realize that a social networking sites an actual space that users can virtually visit and inhabit in much the same ways users, or students, populate classrooms. By inallosers to continuously relate via text, Facebook creates a virtual space that mimics these OrealO social settings.

This focus on the social within the spatial, as realized by Keith and Pile, highlights the essential social relationship aspect Henfebere (1974, trans. 1991) broke ground with by asking, Owhere does a relationship reside when it is not being actualized in a highly determined situation?Ó (p. 401). Over three decades before the conception of this study, it is fair to say that he did notforesee the advent of the Internet, where sites literally OwaitO to be acted upon and interacted with. A site likeacebookexists, but is essentially dormant until users interact with each other and create textual evidence of their interaction. This, was forecast by Lefebvre in analyzing a social relationship through space theory in that when looking at these types of (online and virtual) relationships it may be Oimpossible simply to dubritnafor the form as such is empty, and must have contine order to exist. Nor can it be treated association, which needs objects if it is to operate. Evestracture whose task it is to organize elementary units within a whole, necessarily calls for both the whole and the component units in questionÓ (p 401). This foregrounding displays an essential lesson for using social networking sites in academic spaces: by introducing social space to an academic space, instructors create the possibility of a community formed primarily through situated socialization spatiality may affect student attitudes towards collaboration and textual production.

Currently the Internet is being populated by Web 2.0 sites that featureensec and datareliant platforms to facilitate interactions in purely visual spaces sites take on an interesting character when viewed through the lens of space theory in that effective Web 2.0 sites cater to Othe edges and not just the center O of the web (OOReilly, 2005), meaning that their virtual space is meant to be explored and uncharted territory, not simply major sites that are visited and considered static. By explored cool os occupation within Web 2.0 virtual space alongside elements of activity and space theories, instructors can observe students in purely virtual space outside of academia, instructors can observe how students (re)occupy this non

- ¥ Describe your attitude towards collaboration after the assignment.
- ¥ Would you feel comfortable usingacebookto complete an assignment insula
- ¥ Do you think academic work produced loancebookwould be as high in quality as work produced not usin casebook?
- ¥ After conducting the survey, I will conduct a traditional composition classroom with individual assignments and frontal collaboration to the survey.
- ¥ Midway through the semester I will survey the students with some combination of the following questions:
 - ¥ How do you define collaboration?
 - ¥ Describe your attitude towards collaboration before you completed [some assignment].
 - ¥ Describe your attitude towas collaboration after you completed [some assignment].
 - ¥ Do you think the academic work produced by this collaborative assignment is as high in quality as work that you could have produced on your own?
 - ¥ Did collaborating in a group of peers affect the way proached this academic assignment?
- ¥ For the final collaborative project, I will invite students to form their own groups based on whether they want to use cebookin class to facilitate their collaboration or proceed according to traditional frontal riteods.
- ¥ For the groups that decide to use traditional and frontal methods, I will provide them with a similar survey to the one described above.
- ¥ For the groups that decide to usacebookto collaborate, I will provide them with a survey that asks some commentation of the following questions:
 - ¥ How do you define collaboration?
 - ¥ Describe your attitude towards collaboration before you completed [some assignment].
 - ¥ Describe your attitude towards collaboration after you completed [some assignment].
 - ¥ Do you think the eademic work produced by this collaborative assignment on Facebooks as high in quality as work others produced by not using it?
 - ¥ How was the collaborative process affected by usincebook?
 - ¥ Did usingFacebookfor this assignment affect your definition conflaboration?
 - ¥ Did you useFacebookexclusively in class? At all outside of class?
 - ¥ Would you ever us €acebook to collaborate in another class that didnÕt call for it?

PROJECTED DATA ANALYSIS

After the class is complete I will compile the survey restolts auge student attitudes towards producing OacademicO text, collaboration, acretookusage to see if the class experience has changed attitudes at all. The survey results will be considered independent of student grades or personal consideration equality of studentsO final projects. I am interested in the student attitudes towards the process, not necessarily the quality of the final product.

I am interested in seeing whether or not students currently percarine ookas a strictly social (andcorrespondingly, non

discourse into a safely guarded student space. I am also interested in seeingtowhealt perceptions of peer collaboration, and whether or not this experience has changed that attitude. This may have implications for instructors assuming positive student attitudes towards collaboration regardless of the introduction of technologyallyinl am interested in seeing if allowing Facebookto be used for an academic setting changed student attitudes towards textual production and collaboration. This may have implications for instructors who want students to produce academic text and collaboration in an easy manner without the inherent anxiety of producing quality projects.
